The purpose of this study was to evaluate the number of normal oral examination findings as a predictor for the severity of periodontal disease. This study involved 489 periodontally healthy male and female students at Kobe University, and 124 male and 61 female periodontally healthy patients from the Kobe University Hospital. All participants were divided into 2 groups, a group of 61 patients whose periodontal conditions were considered to be within normal limits (i.e., no teeth with probing depth > or = 4 mm), and a group of 522 patients whose periodontal conditions were considered to be within normal limits (i.e., no teeth with probing depth > or = 3 mm and no teeth with bleeding on probing). All participants were given a full-mouth scaling and root planing in the same day. Oral examination was conducted using a wooden dental mirror, dental probe and periodontal probe. The number of normal oral examination findings was significantly associated with the severity of periodontal disease in the group of periodontally healthy subjects, and the odds ratio (OR) for severe periodontal disease increased as the number of normal oral examination findings decreased. The OR of severe periodontal disease was 1.54 (95% confidence interval (CI): 1.16-2.02) for the group with one normal oral examination finding, 1.45 (95% CI: 0.98-2

FindWindow is a free utility that allows you to locate the open windows of any application with the help of a few command line options. Key Features: It supports the Windows 7 and Windows 8.1. It does not require any installation. It is free of cost, and doesn't require any registration. It is not an emulator. It has minimal impact on the computer's performance. It comes with the tool's usage guide. How To Install: Run the file FindWindow.exe. Double-click the tool to open a graphical interface. Click on the options button to select the required settings. Click on the start button to use FindWindow. Tips: This tool is suitable for both home and office PCs. It can be accessed via a shortcut menu from the systray. It can be used from the command prompt window. It's not an emulator that will launch multiple instances of the app. It does not change the active window unless asked. Some third-party applications, such as Skype, may not work. It can be used to identify the active window only when running within the default application. Run the tool and select the desired option to locate a window by its title or class name. In most cases, it won't switch the focus. The result can be saved in the FindWindow.ini file. You can make the tool run silently or with a status bar. It is not a tool designed for casual computer users. How To Use: Click on the menu button and select Run to start the tool. Click on the Options button to select the required options. Click on the Start button to locate the opened window. In most cases, it will switch the focus to the found window. Do you love FindWindow? Ah, come on! Why don't you make a donation so we can use some nice font in the article and pay our server? You can give what you want and support us at the same time!

What's New in the FindWindow?

Description: FindWindow is a software program that can help you identify a window when you have numerous applications opened. It can be accessed from the systray and can detect windows by names or classes. The tool puts a bunch of useful options at your disposal, such as moving the windows to the center of the screen to draw your attention. Doesn't have to be installed It's not necessary to go through an installation procedure because FindWindow is portable. Therefore, you can save the executable file anywhere on the computer or place it on a USB flash drive to seamlessly run it on any PC and find opened windows. Accessible from a Command Prompt window Double-clicking the file brings up a graphical window with the usage. You have to first open a Command Prompt window and then go to the program's location to call its process by entering the file name and extension. This automatically creates an.ini file in the same directory as the tool, a file which includes window information. Find a window by window title or class name The syntax is FindWindow.exe [Name] [/c:Class] [/f] [/n] [/q] [/s] [/? /h]. Therefore, you can indicate either the window's title or class name, depending on which information you have at hand, and ask the app to flash the window but not change the active state (/f). Moreover, the app can be instructed to move the window to center of the screen (/m), stop writing results in the findwindow.ini file (/n), switch the window focus and bring it to the foreground (/s) and run in quiet mode without showing results (/q). Easy-to-use window finder with CMD support We haven't come across any issues in our tests, thanks to the fact that FindWindow ran errorfree, even on Windows 10. It had minimal impact on the computer's performance in our tests. The tool should be useful for those interested in quickly locating opened windows by title or class. However, it's not designed for casual PC users.The present invention relates to a steam iron or an automatic iron, and more particularly, to a steam iron or automatic iron which can be conveniently operated and used. A conventional steam iron or automatic iron mainly includes a housing in which a driving part such as a motor, a water pump, a driving part control part, a fan motor and so on are mounted. The driving part is driven to drive the fan motor so that steam is driven to flow out of the housing to blow on the object to be heated. A needle is mounted in the housing and is extended out of the housing. The needle is used to press against the object to
