And, in the end, I will be very grateful if you leave a comment with your opinion and a rating from one to five stars, like this: Cataract surgery is one of the most common operations in the world. It is usually done on patients with hard to treat posterior capsular opacification or cataracts. The cataract is a clouding or opacification of the crystalline lens of the eye. About 1.2 million cataract operations are done each year in the United States alone. The cataracts can be either congenital (present at birth) or acquired later in life. There are two main techniques in the prior art for cataract surgery. The first technique is intracapsular, where the entire lens is surgically removed and replaced with an intraocular lens, or IOL. The second technique is extracapsular, where a portion of the lens adjacent to the pupillary opening is surgically removed, leaving the optical portion of the lens intact. Either of these two techniques may be augmented by the implantation of an artificial lens. For example, the lens may be held in place in the capsular bag by one or more loops of one or more soft hydrophilic materials. Both these techniques usually include the removal of the natural lens and replacing it with an IOL. The implanting of the IOL may be performed as described by Buchelt et al. in U.S. Pat. Nos. 4,254,509 and 4,254,510. Other procedures are described by Kelman and Buchalter in U.S. Pat. No. 4,092,744, Tilly in U.S. Pat. No. 4,290,816, Kelman in U
