George Yule *The Study Of Language*. are defined only for strings. The rules for comparing these two strings are as follows.

Character string comparison In JavaScript, strings are compared by checking the initial character at position 0. If it equals the first, then strings are equal. A "word" is a string that contains only letters. All other strings are "word-like" objects. Since A and Z are not in the word list (see above) and B only contains letters, comparison of the strings A and B is done by comparing A's initial character (A) with B's initial character (B), which is fail. The result of the comparison is fail. Similarly, the comparison of B and C fails, and the comparison of C and Z fails. Because only A has the same initial character as Z, they are equal.

Algorithm Comparison As discussed above, two strings are equal if they have the same initial character (or, if there are no other differences, their characters match). For example, the

strings "new" and "new" have the same initial character, so their comparison proceeds as follows: If the first character is new, return true. If not, c6a93da74d
